

Press Release 15/2012

Neustadt-Fernthal, July 5, 2012

BOY's innovative leadership is confirmed during ISB Rhineland-Palatinate event

“LEADERSHIP THROUGH INNOVATION“ was the theme of the investment and structural bank (ISB) event on July 4th in Mayence. In line with the SUCCESS 2012 funded project of Rhineland-Palatinate, outstanding technological developments from the German middle class industry were awarded. BOY was one of the seven prize winners and was awarded for the development of an energy efficient servo motor pump drive.

The newly patented BOY E-Series drive technology can realize energy savings of 50 %. In addition, the jury was impressed with the increased positioning accuracy. Very thin walled parts can be produced precisely within certain repeatability standards. Furthermore, the newly patented drive operates much more quietly.

“Since the introduction of the servo drive four years ago at the Fakuma, many more injection-moulding companies have selected or changed to the BOY E-Series”, stated Alfred Schiffer, Managing Partner of BOY. He proudly held the award presented by the ISB in his hands and added, “Full power with half energy: our new BOY drive technology has now been certified by an independent body. With the E-Series we have laid the foundation for more efficient part production. Now users can implement this technical innovation and reap the benefits for themselves.”
