

Press Release 20/2013

Neustadt-Fernthal, August 20, 2013

Practical help via <http://app.dr-boy.de>

Beginning in September, a practical smartphone application will be available under this internet address. The app, with a design platform by BOY, can be used with any mobile communication device that has internet access.

In addition to a cooling time calculation, the required clamping force can also be determined via individual data input. Extensive data sheets for processing, pre-drying and density of the most common plastics are clearly listed in this free app. This app also includes BOY contact persons in Service, Process Engineering and Sales. A short tap on the desired person and the smartphone automatically calls the person. When material data needs to be reviewed or cooling times need to be calculated on a machine, the required information can be retrieved fast and trouble-free.

Due to the integrated language switching capability the app is not only for the German speaking regions. An overview of the BOY product range with the most important technical data and a short company profile complete the app. With a location map and a link to the detailed BOY website, the BOY app leaves nothing to be desired.
